

CUSTOM MULTI-DIE COLD HEADED PARTS

WCL's multi-die, cold heading sources extend the traditional limit of cold heading, making possible the production of uniquely formed one-piece cold headed parts.

Expensive screw machine parts and multi-piece assemblies can now be economically cold formed as a single piece. The cold forming of parts also improves strength and reliability.

Among the many features that can now be cold formed in a heading operation are:

- **Oversize heads**
- **Special head configurations - knurled, pancake, etc.**
- **Washer heads with oversize washers for spanning and load bearing**
- **Large diameter shoulders to replace separate sleeves and collars**
- **Multiple diameter or "stepped" shoulders**
- **Special pilot or lead points**
- **Double-end collar studs**
- **Gemini® studs**

Design guidance is available to integrate multi-part fasteners into single, cost-effective, one-piece cold headed parts.

SEMS SCREW AND WASHER ASSEMBLIES

Washers are essential to maintaining the integrity of many assemblies. Buying them preassembled to screw assures that they will not be dropped or forgotten in the assembly process. It also greatly simplifies automated production programs.

For most of its more than forty year history, WCL has been a major supplier of all types of quality sems screw and washer assemblies. WCL maintains extensive stocks of Phillips pan head and hex head screws assembled with popular anti-loosening tooth lock washers. The company also stocks a complete line of high performance Square Cone® washer sems assemblies. Many sizes of Phillips pan head tooth washer sems and Square Cone washer sems are stocked in stainless steel as well as carbon plated steel. WCL offers a wide variety of screws and strip resistant screws

assembled to an equally wide variety of washers, including many styles of tooth washers, flat washers, conical washers, helical "split" washers and terminal washers.
